Small Scale Shear Comparison Strength Tests

5/5/99
Revised 5/19/99

This test report contains twelve (12) pages, including the cover sheet. Any additions to, alterations of, or unauthorized use of excerpts from this report are expressly forbidden.

99-1208
ADHESIVE TEST

1. TITLE

PEI Standard No. 99-23.
Small scale shear strength test procedure.

2. TEST OBJECTIVE

To test a two-part polyurethane adhesive intended for the comparison of shear strength values when using a variety of substrates.

3. ADHESIVE MANUFACTURER

Alpha Systems, Inc.
5120 Beck Drive
Elkhart, IN 46516

4. TESTING ORGANIZATION

Progressive Engineering, Inc.
58640 State Road 15
Goshen, IN 46528

5. TESTING PERSONNEL

Director of Testing - Greg A. Weeden
Technician - Jason Holdeman

6. ADHESIVE MATERIAL

Alphaseal 5200 two-part polyurethane adhesive
5/16" Gold Bond gypsum board
1/2" particle board
1/2" plywood
1/2" OSB
2" x 2" SPF lumber
7. TEST CONSTRUCTION

The test samples shall be constructed in eight foot sections with gypsum board, particle board, plywood and OSB attached to a 2 x 2 x 8' piece of SPF. The substrate and 2 x 2s shall be pre-conditioned at 73°F. ±2°F. and 50% ±5% relative humidity for a minimum of 24 hours before applying the adhesive to them. The grain on the substrate shall be parallel with the 8" dimension. To ensure test samples are prepared with no gap between the substrate and 2 x 2, screws were placed every 6". After the test samples are sprayed, condition them at 73°F. ±2°F. and 50% ±5% relative humidity for 24 hours. Care should be taken to ensure that the 2 x 2s are square with the substrate and that the 2 x 2s have square cut ends. Care should also be taken to use good materials without major defects that could effect the test results.

8. TEST PROCEDURE

Each substrate test sample was cut into five (5) 10" x 8" sections. See the attached drawings. After carefully trimming off excess adhesive and removing temporary fasteners, clamp the test sample in a shear fixture as shown on drawing No. 5. Be sure that the sample is square with the load table and that the load is parallel with the 2 x 2. Apply load to the 2 x 2 at a rate of .5 in./min. until an ultimate load is reached. Examine the test sample and record the ultimate load reached and the mode of failure.

9. TEST RESULTS

<table>
<thead>
<tr>
<th>Material</th>
<th>Load Capacity (PLF)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alphaseal on gypsum</td>
<td>1319.0</td>

</tr>
</tbody>
</table>

10. TEST CONCLUSION

The results of the small scale comparison tests show that Alphaseal 5200 applied to gypsum yielded the lowest shear value.
